                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a spider silk protein from the present invention. Spider silk proteins, and peptide fragments within the proteins can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and elasticity than naturally occurring fibres. The fibres can be used in mixed composites. The invention allows the two naturally occurring Nephila clavipes silk proteins to be produced independently so that they can later be combined to form silk fibres of high tensile strength
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1;

                                                                                                                                                                                                                                                                                                                                                              The invention provides isolated cDNA molecules coding for spider silk proteins. The spider silk proteins are characterized by repeating alpha and beta regions and optional variable regions. The DNA sequences are useful in the production of spider silk protein by recombinant DNA techniques. The recombinant spider silk proteins may be used for the production of fibers. The present sequence represents the spider silk protein 1, derived from the major ampullate gland of Nephila clavipes.

                  The present sequence represents the natural spider silk protein spidroine major 1. The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Spider silk protein; spidroine major 1; cosmetic; idermatological compositions; hair care; skin care; hormone; moisturizer; skin disorder; skin disorder

The repeat itself contains 3 regions. The first comprises 0-9 amino acids with a sequence AGG(GX)2. This region is not highly conserved. The second region has a sequence AGG(A)x which is highly conserved and is 8-10 amino acids long. The third segment is (GGX)5 and is 15 amino acids long and is very highly conserved. In most cases X is A,O, Y or L. Remoyal of the poly-(Ala) segments results

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
This sequence represents a synthetic spider dragline variant polymer, CC DP-1A.9. The sequence of the DP-1A.9 monomer is given in AAR99052. CC The polypeptide monomer is a variant based on a consensus sequence CC derived from the fibre forming regions of spider dragline protein, ce esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. CC DNA sequence encoding the monomer may be used in the recombinant protein to production of the variant protein in a recombinant host, e.g. E. coli cor Bacillus subtilis. Synthetic analogues of DP1 were designed to mimic the repeating consensus sequence of the natural protein and the pattern CC of variation among individual repeats. DP-1A analogues are composed CC of a tandemly repeated 101 amino acid monomer which comprises four repeats which differ from the consensus sequence given in AAM06201, CC repeats which differ from the consensus sequence grove in AAM06201 (CC according to the pattern (1)-(5) given below. This 101 amino acid conditions in a series of analogue proteins. The pattern:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DP-1A analogue;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR99053;

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
          A process has been developed for the production of a DNA fragment encoding slik protein. The process involves: (a) selecting target DNA, from a silk-producing spider, that contains many repetitive and non-repetitive regions; (b) selecting a single-stranded DNA primer of at

The present sequence encodes the spider silk protein from Nephila clavipes. The DNA fragment can be used to make fibres, films, woven articles, e.g. for use in parachites, sails, body armour, and absorbers (e.g. of heavy metals, biological weapons, DNA, chemicals, flavours and fragrances). The high molecular weight (90-250 kD) of spider silk proteins can be produced on a commercial scale (at over 2 9/1 cell mass). It has better tensile strength and elasticity than silkworm silk. Inclusion of both repetitive

                                                                                                                                                  This sequence represents a synthetic spider dragline variant polymer, CC DP-1B.9. The sequence of the DP-1B.9 monomer is given in AAR99054. CC The polypeptide monomer is a variant based on a consensus sequence cc derived from the fibre forming regions of spider dragline protein, CC esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. The CC DNA sequence encoding the monomer may be used in the recombinant CC production of the variant protein in a recombinant host, e.g. E. coli CC or Bacillus subtilis. Synthetic analogues of DP1 were designed to mimic CC the repeating consensus sequence of the natural protein and the pattern of variation among individual repeats. This monomer exhibits all of the regularities of (1)-(5) below. In addition, it exhibits a regularity of the natural sequence which is not shared by DP-1A, namely that a repeat CC in which both GYG and GRG are deleted by DP-1A, namely that a repeat CC in the natural sequence of DP-1B matches the natural sequence more closely over CC a more extended segment than does DP-1A. The individual repeats differ CC a more extended segment than does DP-1A. The individual repeats differ CC in the consensus sequence given in AAM06201 according to the pattern: CC consensus sequence given in AAM06201 according to the pattern: CC (1) the poly-alanine sequence varies in length from 0-7 cC (3) aside from the poly-alanine sequence, deletions usually CC encompass integral multiples of three consecutive residues; (4) deletion of GYG is generally accompanied by deletion of GRG in the same sequence; and

The protein improves the moisturizing/ softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                           This sequence represents a synthetic spider dragline variant polymer, CC The polypetide monomer is a variant based on a consensus sequence CC derived from the fibre forming regions of spider dragline protein, CC esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. The CC MA sequence encoding the monomer may be used in the recombinant CC production of the variant protein in a recombinant host, e.g. E. coli CC production of the variant protein in a recombinant host, e.g. E. coli CC the repeating consensus sequence of the natural protein and the pattern CC of variation among individual repeats. This monomer exhibits all of the CC regularities of (1) (5) below. In addition, it exhibits a regularity of CC the natural sequence which is not shared by DP-1A, namely that a repeat CC in which both GVG and GRG are deleted is generally preceded by a repeat cacking the entire poly-alanine repeat, with one intervening repeat. The sequence of DP-1B matches the natural sequence more closely over a more extended segment than does DP-1A. The individual repeats differ CC a more extended segment than does DP-1A. The individual repeats differ CC (1) the poly-alanine sequence varies in length from 0-7 called in the consensus sequence given in AANO6201 according to the pattern: CC (1) the poly-alanine sequence varies in length from 0-7 called in the consensus sequence given in AANO6201 according to the pattern:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rope;

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a polymer of an analogue of the spider silk protein spidroine major 1. The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                        This sequence represents the product of cDNA clone, pMISS1, encoding the orb web spider minor ampullate silk protein MISP1 has been identified and sequenced. Repeat unit peptides of MISP1 may form part of a larger polypeptide with an amino terminus (see AAR80184-85) and a carboxy terminus (see AAR80186-89). Repeat unit peptides make upspider silk proteins (spidroins) which in turn aggregate to form the silk fibres. Spider silk fibres have high tensile strength and significant elasticity. An isolated cDNA clone of a silk protein encoding sequence is of use to produce the protein at high yields
                                                                                                                                                                                                                                                                                                                                          Polypeptide(s) comprising repeated unit amino acid sequences, cDNAs - derived from minor ampullate spider silk proteins and to form spider silk fibres
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                spider silk; repeat unit; consensus; minor ampullate silk protein;

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                        differ from the consensus repeat sequence by deletions of integral multiples of five consecutive amino acids consisting of the pentapeptide sequences GPGGY or GPGQQ. Synthetic analogues of DP2 were designed to minic the repeating consensus sequence of the natural protein and the pattern of variation among individual repeats. The analogue DP-2A is composed of tandemly repeated 119-amino acid peptide monomers which comprises three repeats which differ according to (1)-(2) above. This 119 amino acid monomer is repeated 1-16 times in the DP2 analogues. The proteins may be used to produce fibres of high tensile strength and elasticity, suitable for clothing, rope, surgical sutures, biomaterials for implants, plastic reinforcements, films, coatings, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a synthetic spider dragline variant polymer, DP-2A. The sequence of the DP-2A monomer is given in AAR99058. DP-2 has a repetitive sequence and is rich in Gly and Ala. It is unlike DP-1 except for the region of consecutive Ala residues. The repetitinature of the protein and the pattern of variation lead to the production of the consensus sequence given in AAR99085. The individual repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus sequence according to a pattern while repeats differ from the consensus according to the consensus according to the consensus according to the consensus according to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       fibre forming region; Spidroin 1; Nephila clavipes; DP1; mimi DP-1A analogue; fibre; high tensile strength; elasticity; clo rope; surgical suture; implant; reinforcement; film; coating.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 1995-036479/05

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a polymer of an analogue of the spider silk protein spidroine major 2. The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, bormones, moisturizers or agents for treating disorders of the

 "Sequence conservation in the C-terminal region of spider silk proteins (Spidroin) from Nephila clavipes (Tetragnathidae) and Araneus bicentenarius (Araneidae).";
J. Biol. Cham. 269:6661-6663(1994).
-i- FUNCTION: THIS SPIDER MAJOR AMPULLATE SILK POSSESSES UNIQUE CHARACTERISTICS OF STRENGTH AND ELASTICITY. IT MAY CONSIST OF PSEUDOCRISTALLINE REGIONS OF ANTIPARALLEL BETA-SHEET INTERSPERSED WITH ELASTIC AMORPHOUS SEGMENTS.
-i- SUBUNIT: MAJOR SUBUNIT, WITH SPIDROIN 2, OF THE DRAGLINE SILK.
-i- SUBCELLULAR LOCATION: EXTRACELLULAR.
 SPD1_NEPCL STANDARD; PRT; 747 AA. P.19837; P.19837; O1-FEB-1991 (Rel. 17, Created) O1-NOV-1995 (Rel. 32, Last sequence update) O1-OCT-1996 (Rel. 34, Last annotation update) SPIDROIN 1 (PRAGMENT).

FUNCTION: MAJOR STRUCTURAL PROTEIN OF TISSUES SUCH AS A NUCHAL LIGAMENT, WHICH MUST EXPAND RAPIDLY AND RECOVER SUBUNIT: THE POLYMERIC ELASTIN CHAINS ARE CROSS-LINKED INTO AN EXTENSIBLE 3D NETWORK.
SUBCELLULAR LOCATION: EXTRACELLULAR MATRIX OF ELASTIC FALTERNATIVE PRODUCTS: THERE ARE AT LEAST TWO FORMS OF CELASTIN THAT ARE PRODUCED BY ALTERNATIVE SPLICING.
PTM: THE CROSSLINKS ARE MADE OF DEAMINATED LYS.

CC a process has been developed for the production of a DNA fragment CC encoding silk protein. The process involves: (a) selecting target DNA, CC from a silk-producing spider, that contains many repetitive and non-cc range of the target (b) selecting a single-stranded DNA primer of at CC least 10 nucleotides with a sequence that is complementary to a region CC of the target; (c) repetitively combining the primer with melted target CDNA, incubating the mixture with nucleotides and a DNA polymerase with CC proofreading activity to produce a DNA fragment which is complementary CC to the target and is at least 2 kb long. The present sequence encodes CC to the target and is at least 2 kb long. The present sequence encodes CC used to make fibres, films, woven articles, e.g. for use in parachutes, CC weight (90-250 kD) of spider silk proteins can be produced on a CC commercial scale (at over 2 g/l cell mass). It has better tensile CC strength and elasticity than silkworm silk. Inclusion of both repetitive CC end non-repetitive regions enginees isolation of stabile connections.

 The present sequence represents a spider silk protein from the present invention. Spider silk proteins, and peptide fragments within the proteins, can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and elasticity than naturally occurring fibres. The fibres can be used in mixed composites. The invention allows the two naturally occurring Nephila clavipes silk proteins to be produced independently so that they can later be combined to form silk fibres of high tensile strength

 The invention provides isolated cDNA molecules coding for spider silk proteins. The spider silk proteins are characterized by repeating alpha and beta regions and optional variable regions. The DNA sequences are useful in the production of spider silk protein by recombinant DNA techniques. The recombinant spider silk proteins may be used for the production of fibers. The present sequence represents the spider silk protein 1, derived from the major ampullate gland of Nephila clavipes.

 Matches 477;
 The spider silk protein contains a basic 34 amino acid repeat. The repeat itself contains 3 regions. The first comprises 0-9 amino acids with a sequence AGR(GGX)2. This region is not highly conserved. The second region has a sequence GAG(A)x which is highly conserved and is 8-10 amino acids long. The third segment is (GGX) and is 15 amino acids long and is very highly conserved. In most cases X is A,O, Y or L. Removal of the poly-(Ala) segments results in a silk having lower elasticity.
 DNA encoding spider silk protein-1 and 2 and variants - isolated from Nephila clavipes, for prodn. of spider silk protein and fibres having desired characteristics

 This sequence represents a synthetic spider dragline variant polymer, DP-1A.9. The sequence of the DP-1A.9 monomer is given in AAR99052. The polypeptide monomer is a variant based on a consensus sequence derived from the fibre forming regions of spider dragline protein, esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. DNA sequence encoding the monomer may be used in the recombinant production of the variant protein in a recombinant host, e.g. E. coli or Bacillus subtilis. Synthetic analogues of DP1 were designed to mimic the repeating consensus sequence of the natural protein and the pattern of variation among individual repeats. DP-1A analogues are composed of a tandemly repeated 101 amino acid monomer which comprises four repeats which differ from the consensus sequence given in AAW06201,

 according to the pattern (1)-(5) given below. This 101 amino acid monomer is repeated 1-16 times in a series of analogue proteins. The individual repeats differ from the consensus according to the pattern: (1) the poly-alanine sequence varies in length from 0-7 residues; (2) when the entire poly-alanine sequence is deleted, so also is the surrounding sequence encompassing AGRGGIGGGGARAGG; (3) aside from the poly-alanine sequence, deletions usually encompass integral multiples of three consecutive residues; (4) deletion of GVG is generally accompanied by deletion of GRG in the same sequence; and
 The proteins may be used to produce fibres of high tenselasticity, suitable for clothing, rope, surgical suture for implants, plastic reinforcements, films, coatings,

 This sequence represents the product of cDNA clone, pMISS1, encoding the orb web spider minor ampullate silk protein MiSP1 has been identified and sequenced. Repeat unit peptides of MiSP1 may form part of a larger polypeptide with an amino terminus (see AAR80184-85) and a carboxy terminus (see AAR80186-89). Repeat unit peptides make up and a carboxy terminus (see AAR80186-89). Repeat unit peptides make up spider silk proteins (spidroins) which in turn aggregate to form the silk fibres have high tensile strength and significant elasticity. An isolated cDNA clone of a silk protein encoding sequence is of use to produce the protein at high yields
 Polypeptide(s) comprising repeated unit amino acid sequences, cDNAs - derived from minor ampullate spider silk proteins and to form spider silk fibres

 The spider silk protein contains repeat regions comprising an amorphous region which can form an alpha-helix when stretched and a region which can form betted sheets. Removal of the poly-(Ala) segments results in a silk having lower elasticity. It is envisaged that derivatives of the silk protein could be produced having different tensile strength or elasticity than the natural protein by altering the ratio of different amino acids.
 DNA encoding spider silk protein-1 and 2 and variants - isolated from Nephila clavipes, for prodn. of spider silk protein and fibres having desired characteristics

The present sequence represents a spider silk protein from the present invention. Spider silk proteins, and peptide fragments within the proteins, can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and elasticity than naturally occurring fibres. The fibres can be used in mixed composites. The invention allows the two naturally occurring Nephila clavipes silk proteins to be produced independently so that

 SECTION OF SILK GLANDS.

DOMAIN: COMPOSED OF ANTIPARALLEL BETA SHEETS. THE STRANDS OF THE BETA SHEETS RUN PARALLEL TO THE FIBER AXIS. LONG STRETCHES OF SILK FIBEROIN ARE COMPOSED OF MICROCRYSTALLINE ARRAYS OF (-GLY-SER-GLY-ALA-)N INTERRUPTED BY REGIONS CONTAINING BULKIER RESIDUES.

THE FIBER IS COMPOSED OF MICROCRYSTALLINE ARRAYS ALTERNATING WITH
 AMORPHOUS REGIONS.
 Evol. 38:583-592(1994).

 FUNCTION: MAJOR STRUCTURAL PROTEIN OF TISSUES SUCH AS AORTA A FUNCTION: MAJOR STRUCTURAL PROTEIN OF TISSUES SUCH AS AORTA A NUCHAL LIGAMENT, WHICH MUST EXPAND RAPIDLY AND RECOVER COMPLE SUBUNIT: THE POLYMERIC ELASTIN CHAINS ARE CROSS-LINKED TOGETH INTO AN EXTENSIBLE 3D NETWORK.
SUBCELLULAR LOCATION: EXTRACELLULAR MATRIX OF ELASTIC FIBERS.
FIM: THE CROSSLINKS ARE MADE OF DEAMINATED LYS.
